MC100LVEL92

5 V Triple PECL Input to LVPECL Output Translator

Description

The MC100LVEL92 is a triple PECL input to LVPECL output translator. The device receives standard PECL signals and translates them to differential LVPECL output signals.

To accomplish the PECL to LVPECL level translation, the MC100LVEL92 requires three power rails. The V_{CC} supply is to be connected to the standard 5 V PECL supply, the LV_{CC} supply is to be connected to the 3.3 V LVPECL supply, and Ground is connected to the system ground plane. Both the V_{CC} and LV_{CC} should be bypassed to ground with 0.01 μF capacitors.

The PECL V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Features

- 500 ps Propagation Delays
- 5 V and 3.3 V Supplies Required
- ESD Protection: Human Body Model; > 2 kV, Machine Model; > 200 V
- The 100 Series Contains Temperature Compensation
- LVPECL Operating Range: LV_{CC} = 3.0 V to 3.8 V
- PECL Operating Range: V_{CC} = 4.5 V to 5.5 V
- Internal Input Pulldown Resistors
- Q Output will Default LOW with Inputs Open or < GND + 1.3 V
- Meets or Exceeds JEDEC Spec EIA/JESD78 IC Latchup Test
- Moisture Sensitivity: Level 3 (Pb−Free) For Additional Information, see Application Note AND8003/D
- Flammability Rating: UL 94 V−0 @ 0.125 in, Oxygen Index 28 to 34
- Transistor Count = 247 devices
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Input parameters vary 1:1 with V_{CC}. V_{CC} can vary 4.5 V to 5.5 V.
2. V_{IHCMR} min varies 1:1 with GND. V_{IHCMR} max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP}min and 1.0 V.

Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. LV_{CC} can vary 3.0 V to 3.8 V; V_{CC} can vary 4.5 V to 5.5 V. Outputs are terminated through a 50 Ω resistor to LV_{CC} − 2.0 V.
2. Skews are valid across specified voltage range, part-to-part skew is for a given temperature.
3. Duty cycle skew is the difference between a t_{PLH} and t_{PHL} propagation delay through a device.
4. V_{PP}(min) is the minimum input swing for which AC parameters are guaranteed. The device has a DC gain of ≈40.
