APPLICATION INFORMATION

Input Decoupling

A 1.0 μF tantalum capacitor is the recommended value to be connected between V_{in} and GND. For PCB layout considerations, the traces of V_{in} and GND should be sufficiently wide in order to minimize noise and prevent unstable operation.

Output Decoupling

It is recommended to use a 2.2 μF or higher tantalum capacitor on the V_{out} pin. For better performance, select a tantalum capacitor with low Equivalent Series Resistance (ESR). If you use a tantalum type capacitor with high ESR

value of this capacitor, output might be unstable. For a ceramic type capacitor it is recommended connection about 1 Ω resistor in series for the stability of output voltage. The relation between Output Current of regulator and ESR of an output capacitor is shown in Figures 32 to 34. Those charts show minimal value of ESR for stable output voltage in Fast Transient mode. The minimal ESR of an output ceramic capacitor in Low Power mode is 40 m Ω for all output voltages. For PCB layout considerations, place the output capacitor close to the output pin and keep the leads short as possible.
