

# NCV8664

## Linear Regulator, Low Dropout, Very Low $I_q$

The NCV8664 is a precision 3.3 V and 5.0 V fixed output, low dropout integrated voltage regulator with an output current capability of 150 mA. Careful management of light load current consumption, combined with a low leakage process, achieve a typical quiescent current of 22  $\mu$ A.

NCV8664 is pin and functionally compatible with NCV4264 and NCV4264-2, and it could replace these parts when very low quiescent current is required.

The output voltage is accurate within  $\pm 2.0\%$ , and maximum dropout voltage is 600 mV at full rated load current.

It is internally protected against input supply reversal, output overcurrent faults, and excess die temperature. No external components are required to enable these features.

### Features

- 3.3 V, 5.0 V Fixed Output
- $\pm 2.0\%$  Output Accuracy, Over Full Temperature Range
- 30  $\mu$ A Maximum Quiescent Current at  $I_{OUT} = 100 \mu$ A
- 600 mV Maximum Dropout Voltage at 150 mA Load Current
- Wide Input Voltage Operating Range of 4.5 V to 45 V
- Internal Fault Protection
  - ◆ -42 V Reverse Voltage
  - ◆ Short Circuit/Overcurrent
  - ◆ Thermal Overload
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- EMC Compliant
- These are Pb-Free Devices

**Circuit Description**

The NCV8664 is a precision trimmed 3.3 V and 5.0 V fixed output regulator. Careful management of light load consumption combined with a low leakage process results in a typical quiescent current of 22 μA. The device has current capability of 150 mA, with 600 mV of dropout voltage at full rated load current. The regulation is provided by a PNP pass transistor controlled by an error amplifier with a bandgap reference. The regulator is protected by both current limit and short circuit protection. Thermal shutdown occurs above 150°C to protect the IC during overloads and extreme ambient temperatures.

**Regulator**

The error amplifier compares the reference voltage to a sample of the output voltage (V<sub>out</sub>) and drives the base of a PNP series pass transistor by a buffer. The reference is a bandgap design to give it a temperature-stable output. Saturation control of the PNP is a function of the load current and input voltage. Over saturation of the output power device is prevented, and quiescent current in the ground pin is minimized. The NCV8664 is equipped with foldback current protection. This protection is designed to reduce the current limit during an overcurrent situation.

**Regulator Stability Considerations**

The input capacitor C<sub>IN</sub> in Figure 2 is necessary for compensating input line reactance. Possible oscillations caused by input inductance and input capacitance can be damped by using a resistor of approximately 1 Ω in series with C<sub>IN</sub>. The output or compensation capacitor, C<sub>OUT</sub> helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability. The capacitor value and type should be based on cost, availability, size and temperature constraints. Tantalum, aluminum electrolytic, film, or ceramic capacitors are all acceptable solutions, however, attention must be paid to ESR constraints. The aluminum electrolytic capacitor is the least expensive solution, but, if the circuit operates at low temperatures (-25°C to -40°C), both the value and ESR of the capacitor will vary considerably. The capacitor manufacturer's data sheet usually provides this information. The value for the output capacitor C<sub>OUT</sub> shown in Figure 2 should work for most applications; however, it is not necessarily the optimized solution. Stability is guaranteed at values C<sub>OUT</sub> ≥ 10 μF and ESR ≤ 9 Ω for 5.0 V version, and C<sub>OUT</sub> ≥ 22 μF and ESR ≤ 18 Ω for 3.3 V version, within the operating temperature range. Actual limits are shown in a graph in the Typical Performance Characteristics section.

**Calculating Power Dissipation in a Single Output Linear Regulator**

The maximum power dissipation for a single output regulator (Figure 3) is:

$$P_{D(max)} = [V_{IN(max)} - V_{OUT(min)}] \cdot I_{Q(max)} + V_{I(max)} \cdot I_q \quad (eq. 1)$$

Where:

V<sub>IN(max)</sub> is the maximum input voltage,

V<sub>OUT(min)</sub> is the minimum output voltage,

I<sub>Q(max)</sub> is the maximum output current for the application, and I<sub>q</sub> is the quiescent current the regulator consumes at I<sub>Q(max)</sub>.

Once the value of P<sub>D(Max)</sub> is known, the maximum permissible value of R<sub>θJA</sub> can be calculated:

$$P_{\theta JA} = \frac{150^{\circ}C - T_A}{P_D} \quad (eq. 2)$$

The value of R<sub>θJA</sub> can then be compared with those in the package section of the data sheet. Those packages with R<sub>θJA</sub>'s less than the calculated value in Equation 2 will keep the die temperature below 150°C. In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heat sink will be required. The current flow and voltages are shown in the Measurement Circuit Diagram.

**Heat Sinks**

For proper heat sinking of the SOIC-8 Lead device, connect pins 5 – 8 to the heat sink.

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air. Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of R<sub>θJA</sub>:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (eq. 3)$$

Where:

R<sub>θJC</sub> = the junction-to-case thermal resistance,

R<sub>θCS</sub> = the case-to-heat sink thermal resistance, and

R<sub>θSA</sub> = the heat sink-to-ambient thermal resistance.

R<sub>θJA</sub> appears in the package section of the data sheet.

Like R<sub>θJA</sub>, it too is a function of package type. R<sub>θCS</sub> and R<sub>θSA</sub> are functions of the package type, heat sink and the interface between them. These values appear in data sheets of heat sink manufacturers. Thermal, mounting, and heat sinking are discussed in the ON Semiconductor application note AN1040/D, available on the ON Semiconductor Website.

# MECHANICAL CASE OUTLINE PACKAGE DIMENSIONS

SCALE 1:1

SOIC-8 NB  
CASE 751-07  
ISSUE AK

DATE 16 FEB 2011

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
  2. CONTROLLING DIMENSION: MILLIMETER.
  3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
  4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
  5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
  6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
B	3.80	4.00	0.150	0.157
C	1.35	1.75	0.053	0.069
D	0.33	0.51	0.013	0.020
G	1.27 BSC		0.050 BSC	
H	0.10	0.25	0.004	0.010
J	0.19	0.25	0.007	0.010
K	0.40	1.27	0.016	0.050
M	0°	8°	0°	8°
N	0.25	0.50	0.010	0.020
S	5.80	6.20	0.228	0.244
