NLAS52231

Analog Switch, Dual SPDT, Ultra-Low Ron, 0.4 Ω

The NLAS52231 is a dual SPDT analog switch with overshoot protection on the signal lines. It is ideally suited for audio applications that require very low R_{ON} values for maximum signal transfer. The overshoot protection included in the NLAS52231 allows analog signals on the COM, NO or NC lines to swing safely above V_{CC} without incurring significant leakage. This feature provides added protection against undesirable leakage or damage to the device in the event that an incoming audio signal spikes above its nominal level.

The NLAS52231 features a wide V_{CC} operating range, 1.65 V−4.5 V. It is capable of interfacing with control input select line voltages, V_{IN}, as low as 1.3 V for a V_{CC} of 3.0 V. The NLAS52231 is offered in a very small 1.4mm x 1.8mm 10−pin UQFN package.

Channel switch control/s test socket is normalized. Off isolation is measured across an off channel. On loss is the bandwidth of an On switch. V_{ISO}, Bandwidth and V_{ONL} are independent of the input signal direction.

V_{ISO} = Off Channel Isolation = 20 Log$\left(\frac{V_{OUT}}{V_{IN}}\right)$ for V_{IN} at 100 kHz

V_{ONL} = On Channel Loss = 20 Log$\left(\frac{V_{OUT}}{V_{IN}}\right)$ for V_{IN} at 100 kHz to 50 MHz

Bandwidth (BW) = the frequency 3 dB below V_{ONL}
V_{CT} = Use V_{ISO} setup and test to all other switch analog input/outputs terminated with 50 Ω

DETAILED DESCRIPTION

Overshoot Protection

The NLAS52231 features overshoot protection on the signal lines. This allows input signals to exceed the V_{CC} voltage of the switch up to 1.1 V. This is useful in applications where the input signal has a wide dynamic range and may at times exceed the typical signal swing. It is also helpful in designs that pair a moderate signal swing range with a fairly low operating voltage. Up to 1.1 V above V_{CC}, the NLAS52231 switch will pass signals without distortion and maintain all specified performance characteristics.
