100 W Automotive Pre-Regulator, Non-Isolated, Synchronous Buck, NCV881930-Based Reference Design

ON Semiconductor®

www.onsemi.com

TND6290/D

REFERENCE DESIGN

Overview

This reference design describes the operation and the performance of a 100 W non-isolated synchronous buck automotive pre-regulator, based on the NCV881930 synchronous buck controller with four NVMFS5C460NL 40 V N-channel MOSFET. The reference design shows a complete design for an automotive pre-regulator for a broad range of applications, and highlights the capabilities of the NCV881930 controller.

It is intended for the power supply designer to adopt the circuit directly into a typical system design, making only minimal component changes based on the system requirements.

The design is meant to be a complete solution, but it also provides access to key features of the NCV881930. These include integrated compensation, low I_Q and continuous synchronous mode, wide input range, overcurrent protection, external synchronization, adaptive non-overlap drivers, integrated spread-spectrum, and under voltage lockout.

Key Features

- Complete Automotive Reference Design
- Synchronous Buck Converter with an Input Voltage Range between 6.0 to 16.0 V, Handles Peaks Up to 40 V
- 410 kHz Switching Frequency for Maximum Efficiency
- NCV881930 Low Quiescent Current Automotive Synchronous Buck Converter and Four NVMFS5C460NL 40 V N-channel MOSFET
- Small Form Factor PCB with Four Layers

Figure 1. Reference Design Board Image

Specifications

Table 1. SPECIFICATIONS TABLE

Device	NCV881930
Application	Automotive Pre-Regulator
Input Voltage	6 V to 16 V DC, 40 V Peak
Output Power	Up to 100 W
Topology	Synchronous Buck
Isolation	Non-Isolated
Output Voltage	5.0 V
Nominal Current	15.0 A 20.0 A (Peak)

SCHEMATICS

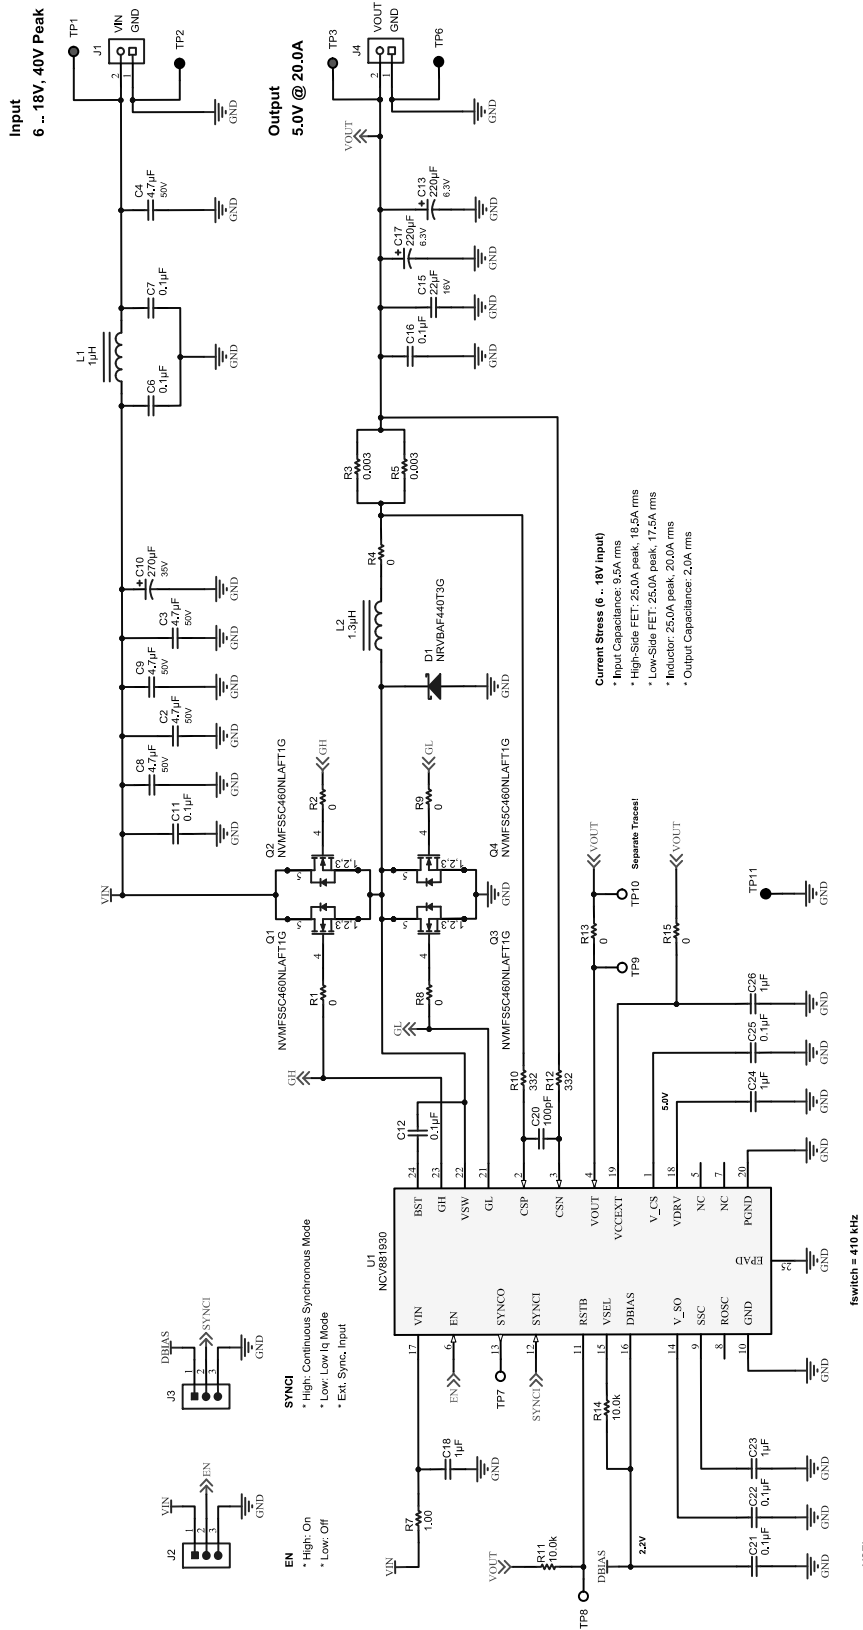

Figure 2. NCV881930 Synchronous Buck Schematic

TND6290/D

BOARD LAYOUT

Figure 3, 4, 5 and 6 shows the top and bottom assembly and the four layers of the PCB. The PCB is 47 mm × 100 mm

(length × width) where the height of the PCB is approximately 12.5 mm.

Figure 3. Top Layer and Assembly Drawing

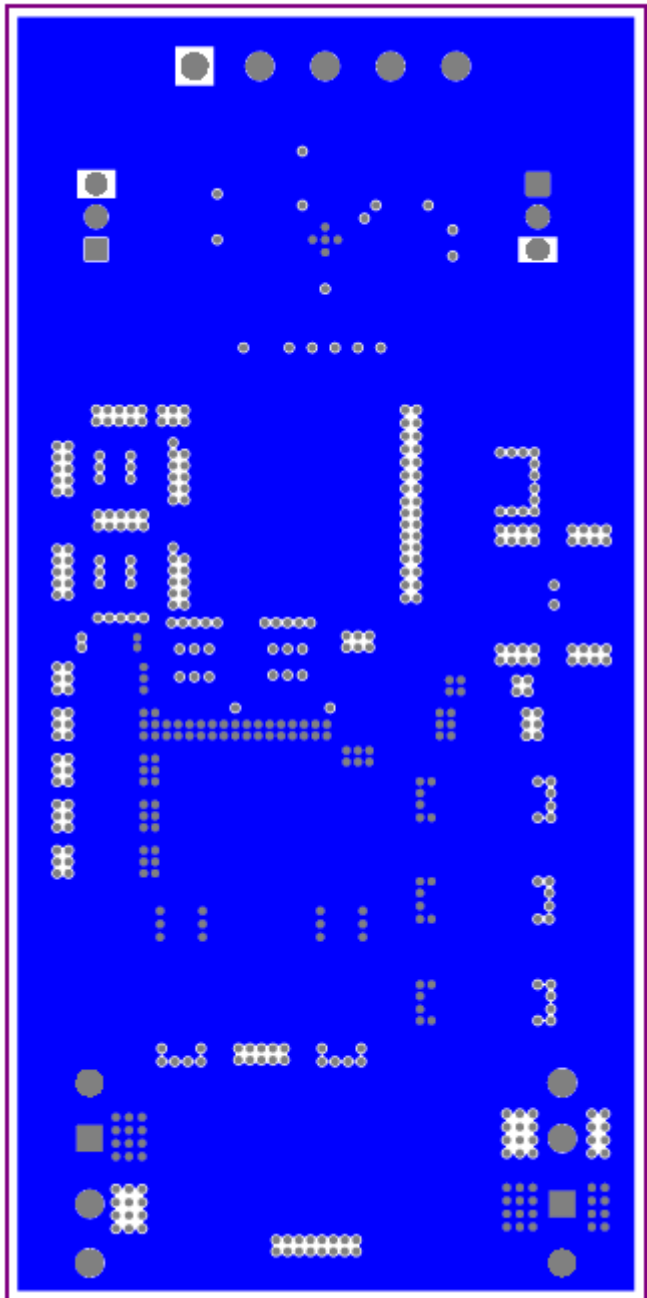

Figure 4. Bottom Layer and Assembly Drawing

Figure 5. Inner Top Layer

Figure 6. Inner Bottom Layer

PERFORMANCE SUMMARY

Output Voltage

NCV881930 has two fixed output voltage options, 3.3 V and 5.0 V. By pulling VSEL pin to DBIAS using a 10 kΩ resistor, the output voltage is set to 5.0 V. Leaving VSEL floating or connecting it to GND, sets the output voltage to 3.3 V.

Depending on the output current, a modification of the power stage (inductor, shunt, and output capacitance) might

be necessary. Therefore please refer to Table 6 in the datasheet.

Efficiency

The efficiency for continuous synchronous mode is shown in Figure 7. This measurement does take into account the losses in the input filter (inductor L1).

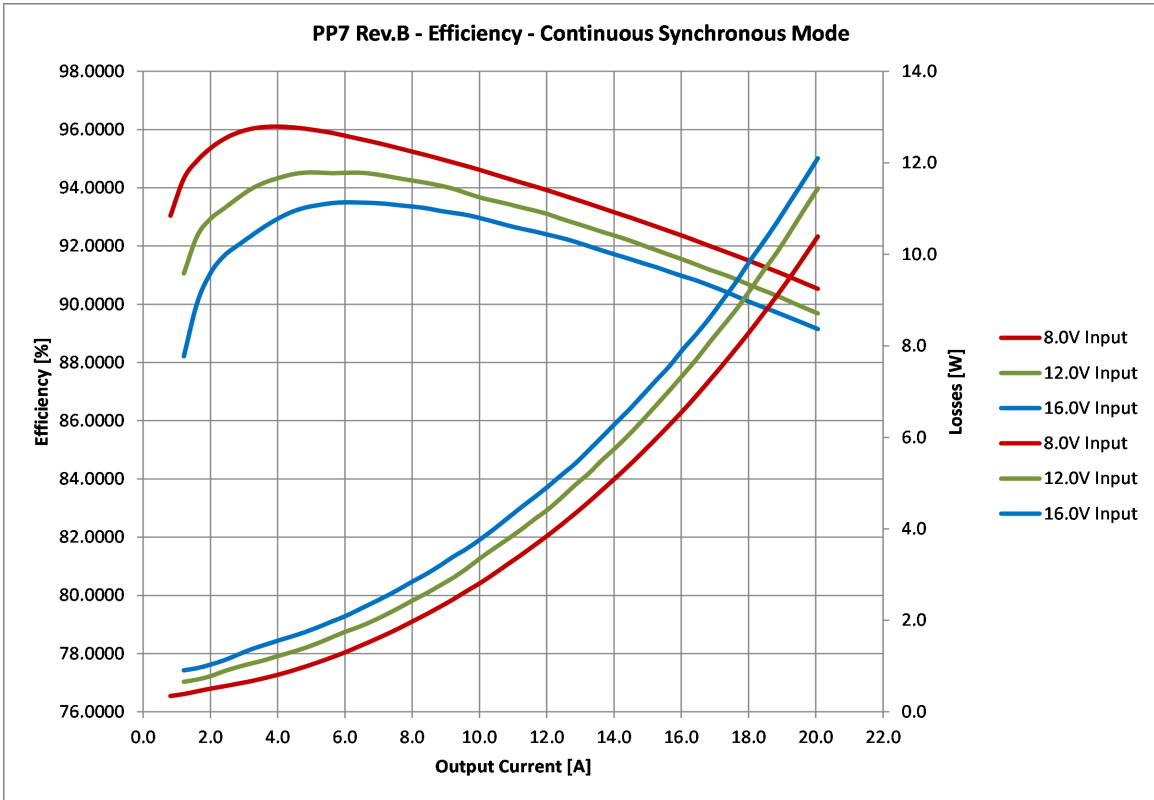

Figure 7. Efficiency for 8.0, 12.0 and 16.0 V Input Voltage

TND6290/D

Thermal Image

The thermal images show the board at an ambient temperature of 21°C with an input voltage of 12.0 V, 10.0 A (Figure 8) and 15.0 A (Figure 9) load.

Component	VIN = 12.0 V @ 10.0 A	VIN = 12.0 V @ 15.0 A
Controller	51.2°C	61.0°C
Upper FETs	74.4°C	87.4°C
Lower FETs	66.7°C	85.3°C
Inductor	58.0°C	80.5°C

Figure 8. Thermal Image at 10.0 A Load

Figure 9. Thermal Image at 15.0 A Load

Transient Response

The response to a load step from 10.0 A to 20.0 A and vice versa at 12.0 V input voltage is shown in Figure 10.

Channel 1

- ◆ Output voltage, -147 mV (-2.94%) undershoot, +147 mV (+2.94%) overshoot
- ◆ 100 mV/div, 100 μs/div, AC coupled

Channel 2

- ◆ Output current, load step 20.0 to 10.0 A and vice versa
- ◆ 10 A/div, 100 μs/div

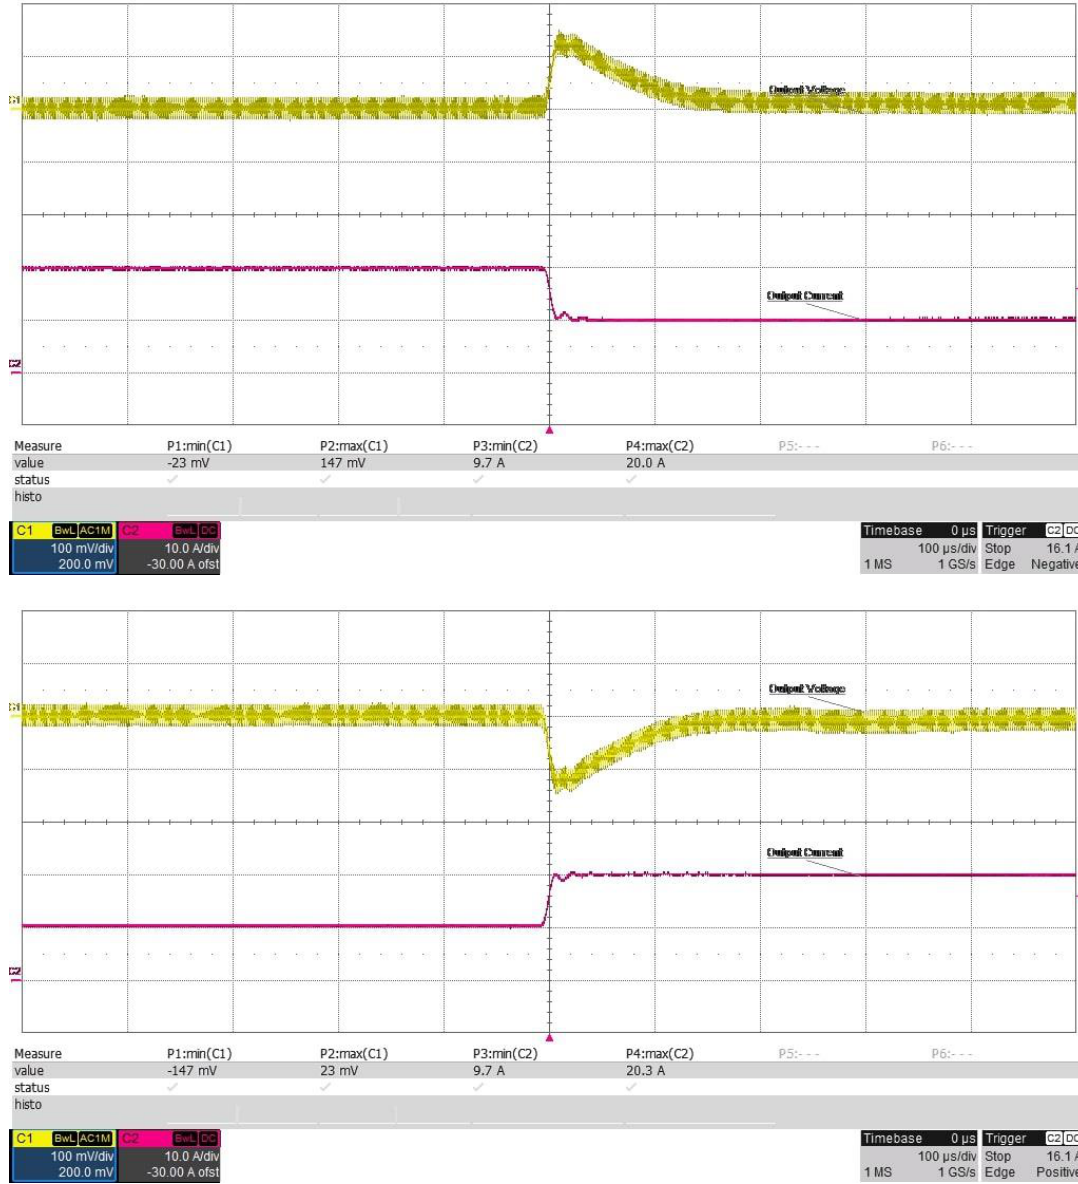

Figure 10. Transient Response on 20.0 A to 10.0 A Load Step Down and 10.0 A to 20.0 A Load Step Up

TND6290/D

Frequency Response

The frequency response at 12.0 V input voltage and 10.0 A and 20.0 A load is shown in Figure 11 and Figure 12.

FREQUENCY RESPONSE

Input Voltage	Output Current	Bandwidth	Phase Margin	Gain Margin
12.0 V	10.0 A	39.2 kHz	90.1°	-17.2 dB
12.0 V	20.0 A	38.1 kHz	92.8°	-15.3 dB

Figure 11. Frequency Response at 10.0 A Load

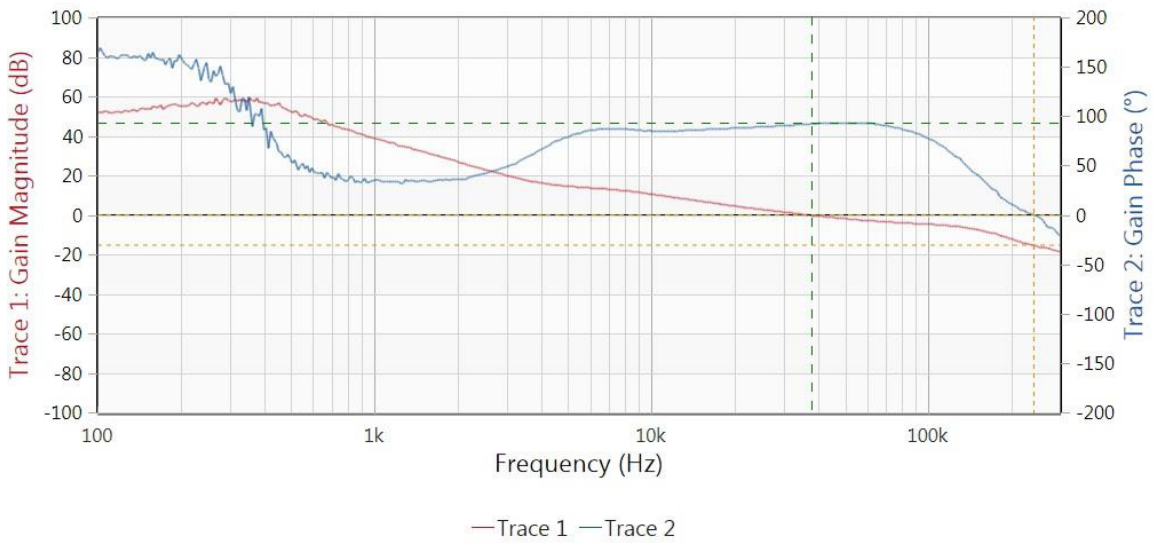

Figure 12. Frequency Response at 20.0 A Load

Impact of Output Capacitance Configuration on Performance

The datasheet of the NCV881930 gives detailed recommendations for the output filter configuration (inductance, shunt resistance, and output capacitance) dependent on the output voltage and current.

Table 2 shows the measurement results for various output capacitor configurations and their corresponding performance regarding ripple, transient response and phase margin.

Different sets of high capacitance ceramic and polymer capacitors were used for the measurements.

- 1x 100 nF, 50 V, 0603, X7R, always populated
muRata GCJ188R71H104KA12D
- 22 μ F ceramic, 16 V, 1210, X7R
muRata GCM32ER71C226ME19L
18 μ F @ 5.0 Vdc, 2 m Ω ESR @ 410 kHz
- 120 μ F polymer
Nichicon PCJ0J121MCL1GS
24 m Ω ESR @ 100 kHz
- 220 μ F polymer
Nichicon PCJ0J221MCL1GS
15 m Ω ESR @ 100 kHz

Table 2. MEASUREMENT RESULTS FOR VARIOUS OUTPUT CAPACITOR CONFIGURATIONS

Polymer: 220 μ F, 6.3 V	2	1	0	# of caps
Polymer: 120 μ F, 6.3V	0	0	3	# of caps
Ceramic: 22 μ F, 16 V	1	1	1	# of caps
Output Ripple, peak-peak	145	162	96	[mV]
Output Ripple, peak-peak	2.90	3.24	1.92	[%]
Transient Response, peak-peak	\pm 147	-183 / +157	-153 / +137	[mV]
Transient Response, peak-peak	2.94	3.66 / 3.14	3.06 / 2.74	[%]
Bandwidth	38.1	66.6	34.5	[kHz]
Phase Margin	92.8	69.4	80.3	[°]
