# 5 kV<sub>RMS</sub>, 4.5-A/9-A Isolated Single Channel Gate Driver

# NCV51153

The NCV51153 is a family of isolated single-channel gate driver with 4.5–A/9–A source and sink peak current respectively. They are designed for fast switching to drive power MOSFETs, IGBTs and SiC MOSFET power switches. The NCV51153 offers short and matched propagation delays. The NCV51153xA provides a split output that controls the rise and fall times individually. The NCV51153xB has its  $V_{CC}$  UVLO referenced to GND2.

The NCV51153 is available in a wide body SOIC–8 package and can support isolation voltage up to 5  $kV_{RMS}$ .

The NCV51153 offers other important protection function such as independent under-voltage lockout for primary and secondary side of the driver.

#### Features

- Feature Options
  - Separated Outputs (NCV51153xA)
  - Wide Bias Voltage Range Including Negative V<sub>EE</sub> and V<sub>CC</sub> UVLO Referenced to GND2 (NCV51153xB)
- 3-V to 20-V Input Supply Voltage
- Output Supply Voltage from 6.5 V to 30 V with 6–V and 9–V for MOSFET, 12–V and 17–V for SiC UVLO Threshold
- 4.5-A Peak Source, 9-A Peak Sink Output Current Capability
- 200 V/ns dV/dt Immunity
- Negative 5-V Handling Capability on Input Pins
- Propagation Delay Typical 36 ns with
  - 5 ns Max Delay Matching
- Gate Clamping During Short Circuit (NCV51153xA)
- AEC-Q100 Qualified for Automotive Application Requirements
- Isolation & Safety
  - 5 kV<sub>RMS</sub> Isolation for 1 Minute (per UL1577 Requirements) (Planned)
  - 4242 V<sub>PK</sub> Reinforced Isolation Voltage (per VDE0884-11 Requirements) (Planned)
  - CQC Certification per GB4943.1-2011 (Planned)
  - SGS FIMO Certification per IEC 62386-1 (Planned)

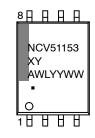

#### **Typical Applications**

- On-board Chargers
- xEV DC-DC Converters
- Traction Inverters
- Charging Stations

SOIC-8 WB CASE 751EW

# **PIN CONNECTIONS**

	Pin	No.		
Pin Name	NCV51153xA	NCV51153xB	I/O	Description
V <sub>DD</sub>	1	1	Power	Input-side Supply Voltage. It is recommended to place a bypass capacitor from V <sub>DD</sub> to GND1.
IN+	2	2	Input	Non-inverting Logic Input with internal pull-down resistor to GND1.
IN-	3	3	Input	Inverting Logic Input with internal pull-up resistor to V <sub>DD</sub> .
GND1	4	4	Power	Ground Input-side. (all signals on input-side are referenced to this ground)
V <sub>CC</sub>	5	5	Power	Positive Output Supply Rail.
OUTH	6	6	Output	Gate Drive Pull-up Output.
OUTL	7	-	Output	Gate Drive Pull-down Output.
GND2	-	7	Power	Gate-drive common pin. Connect this pin to the MOSFET source. $V_{CC}$ UVLO with respect to GND2 for variant B.
V <sub>EE</sub>	8	8	Power	Negative output supply rail for variant B, and ground for variant A.

#### **PIN FUNCTION DESCRIPTION**

#### **INSULATION RATINGS**

Symbol	Parameter		Value	Unit
	Installation Classifications per DIN VDE 0110/1.89	<150 V <sub>RMS</sub>	I–IV	
	Table 1 Rated Mains Voltage	<300 V <sub>RMS</sub>	I–IV	
		<450 V <sub>RMS</sub>	I–IV	
		<600 V <sub>RMS</sub>	I–IV	
		<1000 V <sub>RMS</sub>	1–111	
CTI	Comparative Tracking Index (DIN IEC 112/VDE 0303 Part 1	)	I-IV I-IV I-IV I-IV	
	Climatic Classification		40/125/21	
	Pollution Degree (DIN VDE 0110/1.89)		2	
V <sub>PR</sub>	Input-to-Output Test Voltage, Method b, $V_{IORM} \times 1.875 = V_{P}$ Test with $t_m = 1$ s, Partial Discharge < 5 pC	2250	V <sub>PK</sub>	
VIORM	Maximum Repetitive Peak Isolation Voltage		1200	V <sub>PK</sub>
V <sub>IOWM</sub>	Maximum Working Voltage		870	V <sub>RMS</sub>

DTI	Insulation Thickness		17.3	μm
R <sub>IO</sub>	Insulation Resistance at $T_S$ , $V_{IO}$ = 500 V		10 <sup>9</sup>	Ω

#### SAFETY LIMITING VALUE

Symbol	Parameter	Test Condition	Side	Value	Unit
PS	Safety Supply Power	$R_{\theta JA}$ = 100 °C/W, $T_A$ = 25 °C, $T_J$ = 150 °C	INPUT	0.21	W
			OUTPUT	1.04	W
			TOTAL	1.25	W
T <sub>S</sub>	Safety Temperature			150	°C

#### MAXIMUM RATINGS

Symbol		Parameter	Min	Max	Unit
V <sub>DD</sub> to GND1		Power Supply Voltage – Input Side (Note 2)	-0.3	25	V
V <sub>CC</sub> – Gl	ND2	Positive Supply Voltage – Driver Side	-0.3	33	V
VEE – G	ND2	Negative Supply Voltage for Only B Version (Note 3)	-18	0.3	V
V <sub>CC</sub> – VEE		Differential Supply Voltage - Driver Side (Note 3)	-0.3	33	V
OUT to \	/EE	Driver Output Voltage (Note 3)	V <sub>EE</sub> – 0.3	V <sub>CC</sub> + 0.3	V
OUT to V Transient for 200			V <sub>EE</sub> – 2	V <sub>CC</sub> + 0.3	V
IN+, and	IN-	Input Signal Voltages (Note 2)	-5	V <sub>DD</sub> + 0.3	V
TJ		Junction Temperature	-40	+150	°C
Τ <sub>S</sub>		Storage Temperature	-65	+150	°C
Electrostatic	HBM (Note 5)	Human Body Model	-	2	kV
Discharge Capability	CDM (Note 5)	Charged Device Model	-	1	kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected. 1. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe

Operating parameters.

- All voltage values are given with respect to GND1 pin.
  All voltage values are given with respect to VEE pin.
  This parameter verified by design and bench test, not tested in production.
- This balance verified by design and bench test, not tested in production.
  This device series incorporates ESD protection and is tested by the following methods: ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101) Latch up Current Maximum Rating: ≤100 mA per JEDEC standard: JESD78F.

#### THERMAL CHARACTERISTICS

Symbol	Parameter	PCB	Value	Unit
$\theta_{JA}$	Secondary Thermal Resistance of Junction-Air (Note 6)	Type-A (Note 6)	100	°C/W
		Type-B (Note 7)	115	
$\Psi_{JT}$	Thermal Characterization Parameter Junction-Case Top	Type-A (Note 6)	13	
		Type-B (Note 7)	13	
PD	Secondary Power Dissipation (Note 6)	Type-A (Note 6)	1.25	W
		Type-B (Note 7)	1.08	

 Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.

 As specified for a reference layout shown in Figure 4. The DUT is mounted on a 65 x 40 x 1.6 mm FR4 substrate with an additional heat spreading copper of 240 mm<sup>2</sup>/300 mm<sup>2</sup> (Primary/Secondary). The copper thickness is 1 oz and test conditions is under natural convection or zero air flow.

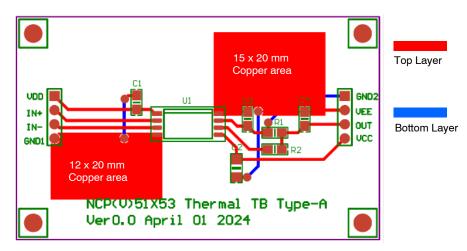

Figure 4. Reference Layout for the Type-A

 As specified for a reference layout shown in Figure 5. The DUT is mounted on a 65 x 40 x 1.6 mm FR4 substrate with an additional heat spreading copper of 240 mm<sup>2</sup>/300 mm<sup>2</sup> (Primary/Secondary). The copper thickness is 1oz and test conditions is under natural convection or zero air flow.

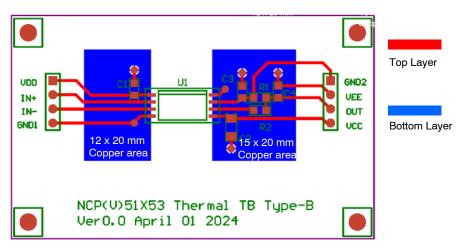

Figure 5. Reference Layout for the Type-B

#### **RECOMMENDED OPERATING CONDITIONS**

Symbol	Rating	Min	Max	Unit	
V <sub>DD</sub>	Power Supply Voltage – Input Side		3.0	20	V
V <sub>CC</sub>	Power Supply Voltage – Driver Side (Note 9)	6.5	30	V	
		8-V UVLO Version	9.5	30	V
		12-V UVLO Version	13.5	30	V
		17-V UVLO Version	18.5	30	V
VEE – GND2	Negative Supply Voltage for only Variant B (NCV51153xB)		-15	0	V
V <sub>IN</sub>	Logic Input Voltage at Pins IN+, and IN-		0	V <sub>DD</sub>	V
T <sub>A</sub>	Ambient Temperature		-40	+125	°C
TJ	Junction Temperature		-40	+125	°C
CMTI	Common Mode Transient Immunity		200	-	kV/μs

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

9. All V<sub>CC</sub> UVLO threshold voltages of the variant A and B are given with respect to V<sub>EE</sub> and GND2 pins respectively.

#### **ISOLATION CHARACTERISTICS**

Symbol Parameter		Condition	Value	Unit
VISO, INPUT TO OUTPUT	Input to Output Isolation Voltage	$T_A$ = 25 °C, Relative Humidity < 50%, t = 1.0 minute, $I_{I-O}$ < 30 $\mu A,$ 50 Hz (Note 10,11,12)	5000	V <sub>RMS</sub>
R <sub>ISO</sub>	Isolation Resistance	V <sub>I_O</sub> = 500 V (Note 10)	10 <sup>11</sup>	Ω

10. Device is considered a two-terminal device: pins 1 to 4 are shorted together and pins 5 to 8 are shorted together.

11.5,000 V<sub>RMS</sub> for 1-minute duration is equivalent to 6,000 V<sub>RMS</sub> for 1-second duration for input to output isolation test, and Impulse Test > 10 m; sample tested for between channel isolation test.
 12. The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage

12. The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating, refer to equipment-level safety specification or DIN VDE V 0884-11 Safety and Insulation Ratings Table.

#### PARAMETER MEASUREMENT DEFINITION

#### **Switching Time Definitions**

Figure 44 shows the switching time waveforms definitions of the turn-on  $(t_{PDON})$  and turn-off  $(t_{PDOFF})$ 

propagation delay times among the driver's input signal IN+ and output signal OUT. The typical values of the propagation delay ( $t_{PDON}$ ,  $t_{PDOFF}$ ), pulse width distortion ( $t_{PWD}$ ) and delay matching between channels times are specified in the electrical characteristics table.

#### Input to Output Operation Definitions

The NCV51153 provides important protection functions such as independent under-voltage lockout for gate driver. Figure 45 shows an overall input to output timing diagram. Under-Voltage Lockout protection on the primary– and secondary-sides power supplies events in the *CASE-A*, *B* and *C* and the gate driver output (OUT) is immediately turn-off when two input signal (IN+ and IN-) are HIGH at same time in the *CASE-D*.

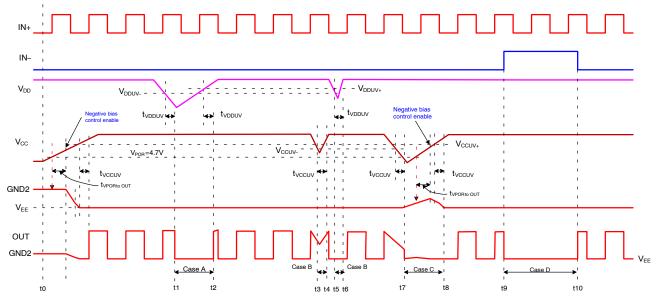

Figure 45. Overall Operating Waveforms Definitions

#### **PROTECTION FUNCTION**

The NCV51153 provides the protection features include Under-Voltage Lockout (UVLO) of power supplies on primary-side ( $V_{DD}$ ) and secondary-side ( $V_{CC}$ ).

#### Under-Voltage Lockout Protection $V_{\text{DD}}$ and $V_{\text{CC}}$

The NCV51153 provides the Under-Voltage Lockout (UVLO) protection function for  $V_{DD}$  in primary-side and gate drive output for VCC in secondary-side as shown in Figure 46. The gate driver is running when the VDD supply voltage is greater than the specified under-voltage lockout threshold voltage (e.g. typically 2.8 V).

In addition, gate output driver has an under-voltage lockout protection (UVLO) function in secondary-side (e.g. VCC).

The variant A and B need to be greater than specified UVLO threshold level with respect to  $V_{EE}$  and GND2

respectively to let the output operate per input signal. The typical  $V_{CC}$  UVLO threshold voltage levels for each option respectively as are per Table 1.

Table 1. V<sub>CC</sub> UVLO OPTION TABLE

	V <sub>CC</sub> UVLO	V <sub>CC</sub> UVLO	V <sub>CC</sub> UVLO Referenced	
Option	Threshold	Variant A	Variant B	Unit
5–V	6.0	V <sub>EE</sub>	GND2	V
8–V	8.7	$V_{EE}$	GND2	V
12–V	12	$V_{EE}$	GND2	V
17–V	17	$V_{EE}$	GND2	V

UVLO protection has the hysteresis to provide immunity to short  $V_{CC}\,drops$  that can occur.

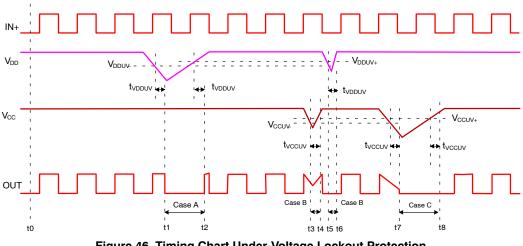

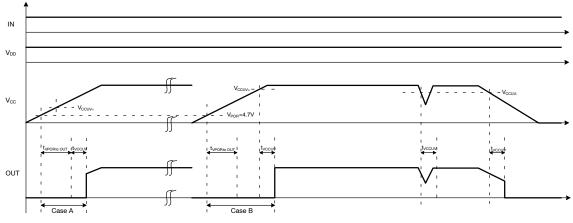

Figure 46. Timing Chart Under-Voltage Lockout Protection

#### Power-up V<sub>CC</sub> UVLO Delay to OUTPUT

To provide a variety of Under-Voltage Lockout (UVLO) thresholds NCV51153 has a power-up delay time during initial  $V_{CC}$  start-up or after POR event.

Before the gate driver is ready to deliver a proper output state, there is a power-up delay time from the  $V_{CC}$  power-on reset (POR) threshold to output and it is defined as  $t_{VPOR to OUT}$  (e.g. typically18 µs). Figure 47 shows the  $V_{CC}$  power-up UVLO delay time diagram.

#### FUNCTIONAL MODES TABLE

Table 2 and Table 3 shows the functional modes for the NCV51153 variant A and B assuming  $V_{DD}$  and  $V_{CC}$  are in the recommended range.

Input		Gate Drive Output		
IN+	IN-	OUTH	OUTL	
LOW	X (Note 17)	Hi–Z	LOW	
X (Note 17)	HIGH	Hi–Z	LOW	
HIGH	LOW	HIGH	Hi–Z	

#### Table 2. FUNCTIONAL MODES FOR THE VARIANT A

Table 3. FUNCTIONAL MODES FOR THE VARIANT B

Input		Gate Drive Output	
IN+	IN–	OUT	
LOW	X (Note 17)	LOW	
X (Note 17)	HIGH	LOW	
HIGH	LOW	HIGH	

17.X: Don't care

#### **APPLICATION INFORMATION**

This section provides application guidelines when using the NCV51153.

#### Power Supply Recommendations

The NCV51153 variant A and B are designed to support unipolar or bipolar power supply respectively.

The VDD input power supply supports a wide voltage range from 3 V to 20 V and the VCC output supply supports a voltage range from 6.5 V to 30 V. The  $V_{CC}$  local bypass capacitor should be placed between the  $V_{CC}$  and  $V_{EE}$  pins with a value of at least ten times the gate capacitance, and an additional capacitor 100–nF in parallel for device biasing and both capacitors located as close to the device as possible. A low ESR, ceramic surface mount capacitors are recommended. Additionally, for the negative bias supply capacitor should be placed between GND2 and  $V_{EE}$  pins with a value of at least few hundred nanofarads (variant B).

Similarly, the  $V_{DD}$  bypass capacitor should also be placed between the  $V_{DD}$  and GND1 pins for input logic power supply. We recommend using 2 capacitors; at least 100 nF ceramic surface-mount capacitor with few microfarads added in parallel and both capacitors also located as close to the pins of the device as shown in Figure 48.

• In Unipolar power supply the driver is typically supplied with a positive voltage at  $V_{CC}$ . For operation with unipolar supply, the  $V_{CC}$  supply is connected to 15 V with respect to  $V_{EE}$  pin for IGBTs and MOSFET and 20 V for SiC MOSFETs (variant A).

 In bipolar power supply the driver is typically supplied of the V<sub>CC</sub> and VEE power supplies. Typical supply values for bipolar operation are 15 V and -8 V with respect to GND2 for IGBTs and 20 V and -5 V for SiC MOSFETs. Negative power supply prevents the power device from unintentionally turning on because of current induced from the Miller effect (variant B).

#### Input Stage

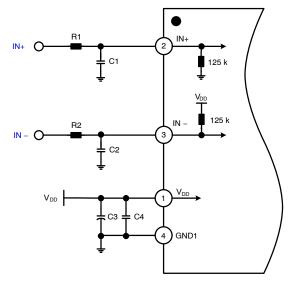

Figure 48. Schematic of Input Stage

The input signal pins (IN+, and IN–) of the NCV51153 are based on the TTL compatible input-threshold logic that is independent of the VDD supply voltage.

The logic level compatible input provides a typically HIGH and LOW threshold of 1.6 V and 1.1 V respectively.

The input signal pins impedance is  $125 \text{ k}\Omega$  typically and the IN+ pin is pulled to GND1 pin and IN- pin is pulled to V<sub>DD</sub> pin as shown in Figure 48. For non-inverting input logic input signal is applied to IN+ while the IN- input can be used as an enable function. If IN- is pulled HIGH, the driver output remains LOW state regardless of the state of IN+. To enable the driver output, IN- should be tied to GND1 through a few tens of k $\Omega$  resistor (e.g.10 k $\Omega$ ) or can be used as an active LOW enable pull down.

- Non-inverting input IN+ controls the driver output while inverting input IN- is set to LOW
- Inverting input IN- controls the driver output while non-inverting input IN+ is set to HIGH

An RC filter is recommended to be added on the input signal pins to reduce the impact of system noise and ground bounce as shown in Figure 48. Such a filter should use an  $R_{IN}$  in the range of 0  $\Omega$  to 100  $\Omega$  and a  $C_{IN}$  between 10 pF and 100 pF.

#### **Output Stage**

The NCV51153 have different output stages of the variant A and B as shown in Figure 49.

For the variant A is designed to support separate source (OUTH) and sink (OUTL) outputs. This scheme allows a single resistor between each pin and the MOSFET gate to independently control gate ringing as well as fine tuning  $dV_{DS}/dT$  turn-on and turn-off transitions present on the MOSFET drain-source voltage.

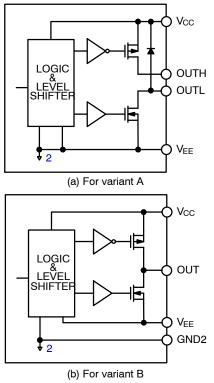

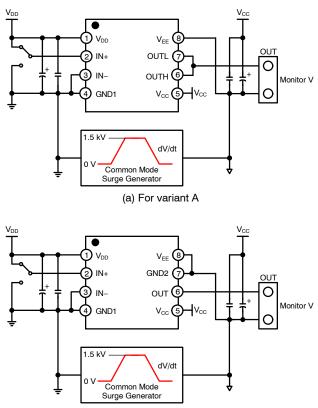

Figure 49. Schematic of Output Stage

The output impedance of the pull up and pull down switches shall be able to provide about +4.5 A and -9 A peak currents typical at 25 °C and the minimum sink and source peak currents are -7 A sink and +2.6 A source at 125 °C.

#### Common Mode Transient Immunity Testing

Figure 50 shows a simplified diagram of the Common Mode Transient Immunity (CMTI) testing configuration for each the variant A and B. CMTI is the maximum sustainable common-mode voltage slew rate while maintaining the correct output. CMTI applies to both rising and falling common-mode voltage edges. CMTI is tested with the transient generator connected between GND1 and  $V_{EE}$  ( $V_{CM}$ = 1500 V).

(b) For variant B

#### PCB Layout Guideline

To improve the switching characteristics and efficiency of design, the following should be considered before beginning a PCB layout.

#### **Component Placement**

- Keep the input/output traces as short as possible. Minimize influence of the parasitic inductance and capacitance on the layout. (To maintain low signal-path inductance, avoid using via).
- Placement and routing for supply bypass capacitors for V<sub>DD</sub>, V<sub>CC</sub> and V<sub>EE</sub> and gate resistors need to be located as close as possible to the gate driver.
- The gate driver should be located to the switching device as close as possible to decrease the trace inductance and avoid output ringing.

#### Grounding Consideration

• Have a solid ground plane underneath the high-speed signal layer.

# High-Voltage (VISO) Consideration

• To ensure isolation performance between the primary and secondary side, any PCB traces or copper should be not placed under the driver device as shown in Figure 51. A PCB cutout is recommended to avoid contamination that may impair the isolation performance of NCV51153.

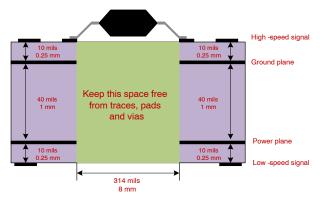

Figure 51. Recommended Layer Stack

Figure 52 shows the 3D layout of the top view of an evaluation board. The component's location of the PCB cutout between primary and secondary sides ensures isolation performance.
