Eval Board User's Manual

Table 1. GENERAL PARAMETERS

Devices	Applications	Input Voltage	Output Power	Topology	Board Size
NCP1399 NCP1602 NCP4305 NCP4354 NCP4810	High Power NB Adapter	85 – 260 V _{AC}	150 W	CRM PFC & LLC	142 × 67.5 × 19.5 mm 13.16 W/inch ³
Output Voltage	V _{OUT} Ripple	Efficiency	Operating Temperature	Cooling	Standby Power
19.5 V/7.7 A (9 A Curr. Limit)	< 150 mV 3 to 7 A Load Steps	Above 91% @ I _{LOAD} > 2 A	0–50°C	Convection Open Frame	< 130 mW

Description

This evaluation board user's manual provides elementary information about a high efficiency, low no-load power consumption reference design that is targeting power laptop adapter or similar type of equipment that accepts 19.5 V_{DC} on the input.

The power supply implements PFC front stage to assure unity power factor and low THD, current mode LLC power stage to enhance transient response and secondary side synchronous rectification to maximize efficiency. This design focuses mainly on the NCP1399 current mode LLC controller description – please refer to NCP1602 and NCP4305 material to gain more information about these devices.

The NCP1399 is a current mode LLC controller which means that the operating frequency of an LLC converter is not controlled via voltage (or current) controlled oscillator but is directly derived from the resonant capacitor voltage signal and actual feedback level. This control technique brings several benefits compare to traditional voltage mode controllers like improved line and load transient response and inherent out of zero voltage switching protection. The LLC controller also features built-in high voltage startup and PFC operation control pins that ease implementation of a power supply with PFC front stage and no standby power supply on board.

The enhanced light load operation of the LLC controller allows SMPS design to pass the latest no-load and light load consumption limits and still keeping output regulated with excellent transient response from no-load to full-load steps.

Key Features

- Wide Input Voltage Range
- Small Form Factor/High Power Density
- High Efficiency
- Low No-load Power Consumption
- Fast Startup
- X2 Capacitor Discharge Function
- Near Unity Power Factor
- Low Mains Operation Protection
- Overload Protection
- Secondary Short Circuit Protected
- Thermal Protection
- Regulated Output Under any Conditions
- Excellent Load and Line Transient Response
- Capability to Implement Off-mode for Extremely Low No-load Power Consumption

Detail Demo-board Schematic Description

Figure 1. Laptop Adapter Demo-board – Main Board Schematic

Figure 2. Laptop Adapter Demo-board – SR Daughtercard Schematic

The input EMI filter is formed by components L₈, L₂, L₅, C₄₇, C₁, C₄, C₆, R₅, R₆, R₁₀ and R₄₈. The IC₁ (NCP4810) with safety resistors R₁, R₁₆, R₄₃, R₅₃ is used to assure lose-less X2 capacitor discharge function after application is disconnected from the mains.

The PFC power stage uses standard boost PFC topology formed by power components B₁, L₁, D₅, Q₁, R₁₁, R₃₈, and bulk capacitor C₁₆. The PFC controller IC₈ (NCP1602) senses input voltage indirectly – via PFC power MOSFET drain voltage sensing network R₁₃₅, R₁₃₄, R₁₀₂ and R₁₀₁. The PFC coil current is sensed by the shunt resistors R₁₁ and R₃₈. The series resistor R₈₁ defines maximum PFC front stage peak current. The PFC feedback divider is shared with LLC brown-out sensing network in order to reduce application no-load power consumption. The PFC FB/LLC BO divider is formed by resistors R₁₇, R₂₈, R₃₄, R₄₆, R₁₂₉, R₁₃₀, R₁₃₂, R₁₃₃ and R₁₄₉. The FB signal is filtered by capacitor C₂₆ to overcome possible troubles caused by the parasitic capacitive coupling between pin and other nodes that handle high dV/dt signals. The internal bulk voltage regulator compensation C₄₀, C₃₆ and R₇₅ is connected to the IC₈ pin 1. The PFC MOSFET is driven via circuitry R₁₉, R₂₅, R₂₆, R₃₃, D₇ and Q₄. This solution allows to select needed turn-on and turn-off process speed for Q₁ and also to handle gate discharge current in local loop – minimizing EMI caused by the driver loop.

The LLC power stage primary side composes from these devices: MOSFETs Q₂, Q₃, external resonant coil L₃, transformer TR₁ and resonant capacitor C₁₈. The IC₃ (NCP1399Ax) LLC controller senses primary current indirectly – via resonant capacitor voltage monitoring which is divided down by capacitive divider R₃₂, C₁₇, C₂₉, C₃₂ and C₆₂. The capacitive divider has to provide minimum phase shift between resonant capacitor signal and divided signal on the LLC_CS pin. The capacitive divide has to be loaded

in the same time to assure fast LLC_CS pin signal stabilization after application startup – this is achieved by resistor R₁₄₈. The series resistor R₂₃, R₂₄, and R₆₄ is used to limit maximum current that can flow into the LLC_CS pin. The FB optocoupler OK₁ is connected to the LLC_FB pin and defines converter output by pulling down this pin when lower output power is needed. Capacitor C₅₀ forms high frequency pole in FB loop characteristics and helps to eliminate eventual noise that could be coupled to the FB pin by parasitic coupling paths. The Brown-Out resistor sensing network was already described in PFC section as it is shared with PFC feedback sensing. The Skip/REM pin of the NCP1399 is used for skip threshold adjustment in this demo-board option. Resistors R₁₀₃ and R₁₀₄ are used for this purpose together with noise filtering capacitor C₅₇. The over-voltage and over-temperature protections are implemented via OVP/OTP pin by using resistor R₆₇, temperature dependent resistor NTC₁, filtering capacitor C₄₄ and optocoupler OK₂. The OVP comparator is located on the secondary side to assure maximum OVP circuitry accuracy. The PFC ON/OFF function is not used in this revision of demo-board – i.e. the bulk voltage is regulated to nominal level during entire board operation (full, medium, light or no-load conditions) thus the P_ON/OFF pin is connected to ground via resistor R₁₀₅. The PFC_MODE pin provides bias to the PFC controller via series resistor R₁₀₀ after high enough voltage is available on the LLC VCC capacitors C₃₇. The VCC decoupling capacitor C₅₄ and also bootstrap capacitor for high side driver powering C₅₃ are located as close to the LLC controller package as possible to minimize parasitic inductive coupling to other IC adjust components due to high driver current peaks that are present in the circuit during drivers rising and falling edges transitions. The bootstrap capacitor is charged via HV bootstrap diode D₂₃ and series resistor R₉₆ which limits

charging current and V_{boot} to HB power supply slope during initial C_{53} charging process. The gate driver currents are reduced by added series resistors R_{54} , R_{55} to optimize EMI signature of the application.

The primary controllers bias voltage limiter circuitry is used in order to restrict upper value of the primary V_{CC} voltage to approximately 13 V. The VCC limiter composes of these components: resistors R_4 , R_{150} , capacitors C_2 , C_3 , diodes D_3 , D_2 , D_6 , D_{26} and transistor Q_6 .

The secondary side synchronous rectification is located on separated Daughter-card and uses IC_1 and IC_2 SR controllers – NCP4305D. The SR MOSFETs for each SR channel are Q_1 and Q_2 . RC snubber circuits C_9 , R_1 , C_{10} and R_{11} , are used to damp down the parasitic ringing and thus limit the maximum peak voltage on the SR MOSFETs. The SR controllers are supplied from converter output via resistors R_1 and R_4 . These resistors form RC filter with decoupling capacitors C_1 to C_6 . The minimum on-time – R_3 , R_6 and minimum off-time – R_2 , R_5 resistors define needed blanking periods that help to overcome SR controllers false triggering to ringing in the SR power stage. The light load detection circuit (LLD) is formed by resistors R_7 , R_8 , R_9 capacitor C_7 , C_8 , and diodes D_1 , D_2 . The SR controllers are disabled by LLD circuitry when application enters skip

mode – this helps to reduce no-load power consumption of application. The trigger/disable function of NCP4305 is not used in this application thus the corresponding pins are grounded.

The output voltage of the converter is regulated by Secondary Side Sleep mode Controller NCP4354A – IC_{101} . The regulation optocoupler OK_1 is driven via resistor R_{18} which defines loop gain. The NCP4354 is biased via resistor R_{123} with decoupling capacitor C_{109} . The output voltage is adjusted by divider R_{65} , R_{117} , R_{118} , R_{127} and R_{119} . The feedback loop compensation network is formed partially by these components, resistor R_{128} and capacitor C_{111} . The output filtering capacitor bank composes from low ESR capacitors C_8 to C_{11} . Output filter L_1 , C_5 is used to clean out output voltage from switching glitches.

The secondary side OVP sense circuitry is using zener diode D_4 , resistors R_{82} , R_{84} and capacitor C_{30} . The OVP threshold is adjusted by selected type of zener diode.

There are several options prepared in the PCB layout so that customer can modify demo-board according to his target application needs. Mentioned options for instance allow implementation of off-mode control from secondary side to further reduce no-load power consumption or different PFC front stage controller implementation.

You are responsible for determining whether the board will be suitable for your intended use or application or will achieve your intended results. Prior to using or distributing any systems that have been evaluated, designed or tested using the board, you agree to test and validate your design to confirm the functionality for your application. Any technical, applications or design information or advice, quality characterization, reliability data or other services provided by **onsemi** shall not constitute any representation or warranty by **onsemi**, and no additional obligations or liabilities shall arise from **onsemi** having provided such information or services.

onsemi products including the boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. You agree to indemnify, defend and hold harmless **onsemi**, its directors, officers, employees, representatives, agents, subsidiaries, affiliates, distributors, and assigns, against any and all liabilities, losses, costs, damages, judgments, and expenses, arising out of any claim, demand, investigation, lawsuit, regulatory action or cause of action arising out of or associated with any unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of any products and/or the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by **onsemi** to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

onsemi does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: **onsemi** shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if **onsemi** is advised of the possibility of such damages. In no event shall **onsemi**'s aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.

The board is provided to you subject to the license and other terms per **onsemi**'s standard terms and conditions of sale. For more information and documentation, please visit www.onsemi.com.
