

# Tracking Regulator/Line Driver - Micropower, Low Dropout

## 200 mA

ON Semiconductor®

[www.onsemi.com](http://www.onsemi.com)

## NCV8182C

The NCV8182C is a monolithic integrated low dropout tracking regulator designed to provide an adjustable buffered output voltage that closely tracks the reference input. The output delivers up to 250 mA while being able to be configured higher, lower or equal to the reference voltages.

The device has been designed to operate over a wide input and  $V_{REF/EN}$  operating voltage range while still maintaining excellent DC characteristics. The NCV8182C is protected from reverse battery, short circuit and thermal runaway conditions. The device also can withstand load dump transients and reverse polarity input voltage transients. This makes it suitable for use in automotive environments.

The  $V_{REF/EN}$  lead serves two purposes. It is used to provide the input voltage as a reference for the output and it also can be pulled low to place the device in sleep mode.

### Features

- Output Voltage Tracking Tolerance: max.  $\pm 10$  mV
- Output Current: up to 250 mA
- Low Disable Current (Typ. 20  $\mu$ A @  $V_{REF/EN} = 0$  V)
- Low Dropout Voltage (Typ. 240 mV @ 200 mA)
- Wide Input and  $V_{REF/EN}$  Operating Voltage Range
- Protection Features:
  - ◆ Current Limit
  - ◆ Thermal Shutdown
  - ◆ Reverse Polarity Protection
- Internally Fused Leads in SOIC-8 Package
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- These are Pb-Free Devices

### Typical Applications (For safety applications refer to Figure 26)

- Engine Control Unit, Transmission Control Unit, Comfort Controls, Infotainment, Sensors, Local Controls, Tire Pressure Monitor, Machine Controls, Switch and Sensor Reading, Operator Interface Control

Figure 3. Pin Connections

## PIN FUNCTION DESCRIPTION

Pin No. SOIC-8	Pin No. DPAK-5	Pin Name	Description
8	1	$V_{in}$	Positive Power Supply Input. Connect 1.0 $\mu\text{F}$ capacitor to ground.
1	2	$V_{out}$	Tracker Output Voltage. Connect 10 $\mu\text{F}$ capacitor with $\text{ESR} < 1.9 \Omega$ to ground.
2, 3, 6, 7	3	GND	Power Supply Ground.
4	4	ADJ	Voltage Adjust Input. The adjust input can be connected directly to output pin for $V_{out} = V_{REF/EN}$ or by a voltage divider for higher/lower output voltages. The adjust pin can be also connected to ground in case of using this device as a High-Side Driver.
5	5	$V_{REF/EN}$	Reference Voltage and ENABLE Input. Connect the reference to this pin. A low signal disables the IC; a high signal switches it on. The reference voltage can be connected directly or by a voltage divider for lower output voltages. Connect 10 nF capacitor to ground.

# NCV8182C

## ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input Voltage DC (Note 1) DC	$V_{in}$	-16	45	V
Input Voltage (Note 2) Load Dump – Suppressed	$U_S^*$	-	60	V
Output Voltage	$V_{out}$	-10	40	V
Reference Voltage / Enable Input DC DC	$V_{REF/EN}$	-10	40	V
Adjust Input Voltage DC DC	$V_{ADJ}$	-10	40	V
Maximum Junction Temperature	$T_{J(max)}$	-40	150	°C
Storage Temperature	$T_{STG}$	-50	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class B according to ISO16750-1.

## ESD CAPABILITY (Note 3)

Rating	Symbol	Min	Max	Unit
ESD Capability, Human Body Model	$ESD_{HBM}$	-2	2	kV
ESD Capability, Charged Device Model	$ESD_{CDM}$	-1	1	kV

3. This device series incorporates ESD protection and is tested by the following methods:  
ESD Human Body Model tested per AEC-Q100-002 (JS-001-2017)  
Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes smaller than 2 x 2 mm due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2018.

## LEAD SOLDERING TEMPERATURE AND MSL (Note 4)

Rating	Symbol	Min	Max	Unit
Moisture Sensitivity Level SOIC-8 (Note 5) DPAK-5	MSL		1 1	-

4. For more information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D
5. Device is under development. Values subject to change.

## THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Characteristics, SOIC-8 (Note 5) Thermal Resistance, Junction-to-Air (Note 6) Thermal Reference, Junction-to-Lead (Note 6)	$R_{\theta JA}$ $R_{\psi JL2}$	113 16	°C/W
Thermal Characteristics, SOIC-8 (Note 5) Thermal Resistance, Junction-to-Air (Note 7) Thermal Reference, Junction-to-Lead (Note 7)	$R_{\theta JA}$ $R_{\psi JL2}$	88 16	°C/W

## RECOMMENDED OPERATING RANGES

Rating	Symbol	Min	Max	Unit
Input Voltage	$V_{in}$	3.4	35	V
Reference Voltage / Enable Input	$V_{REF/EN}$	2.75	34	V
Junction Temperature	$T_J$	-40	150	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

**ELECTRICAL CHARACTERISTICS**  $V_{in} = 13.5\text{ V}$ ,  $V_{REF/EN} \geq 2.75\text{ V}$ ,  $C_{in} = 1\text{ }\mu\text{F}$ ,  $C_{out} \geq 10\text{ }\mu\text{F}$ ,  $C_{VREF/EN} = 10\text{ nF}$ , for typical values  $T_J = 25^\circ\text{C}$ ; for min/max values  $T_J = -40^\circ\text{C}$  to  $150^\circ\text{C}$ ; unless otherwise noted. (Note 8)

Parameter	Test Conditions	Symbol	Min	Typ	Max	Unit

## DEFINITIONS

### General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

### Output Voltage Tracking (Accuracy)

The output voltage tracking (accuracy) parameter is defined for specific temperature, input voltage and output current values or specified over Line, Load and Temperature ranges.

### Line Regulation

The change in output voltage for a change in input voltage measured for specific output current over operating ambient temperature range.

### Load Regulation

The change in output voltage for a change in output current measured for specific input voltage over operating ambient temperature range.

### Dropout Voltage

The input to output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. It is measured when the output drops 100 mV below its nominal value. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

### Quiescent Current

Quiescent Current ( $I_q$ ) is the difference between the input current (measured through the LDO input pin) and the output load current. If Reference/Enable pin is set to LOW (Off – State) the regulator reduces its internal bias and shuts off the output, this term is called the disable current ( $I_{DIS}$ ).

### Current Limit

Current Limit is value of output current by which output voltage drops below 90% of  $V_{REF/EN}$  nominal value. It means that the device is capable to supply minimum 250 mA.

### PSRR

Power Supply Rejection Ratio is defined as ratio of output voltage and input voltage ripple. It is measured in decibels (dB).

### Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 180°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

### Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

The NCV8182C low dropout tracking regulator is self-protected with internal thermal shutdown and internal current limit. Typical characteristics are shown in Figure 4 to Figure 21.

**Input Decoupling ( $C_{in}$ )**

A ceramic or tantalum 1  $\mu$ F capacitor is recommended and should be connected close to the NCV8182C package. Higher capacitance and lower ESR will improve the overall line and load transient response.

**Output Decoupling ( $C_{out}$ )**

The NCV8182C is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. Stability region of ESR vs. Output Current is shown in Figure 8. The minimum output decoupling value is 10  $\mu$ F and can be augmented to fulfill stringent load transient requirements. The tracking regulator works with ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load transient response.

**Tracking Regulator Operation**

The output voltage  $V_{out}$  is controlled by comparing it to the voltage applied at pin  $V_{REF/EN}$  and driving a PNP pass device accordingly. The loop stability depends on the output capacitor  $C_{out}$ , the load current, the chip temperature and the poles/zeros introduced by the integrated circuit.

Protection circuitry prevent the IC as well as the application from destruction in case of catastrophic events. These safeguards contain output current limitation, reverse polarity protection as well as thermal shutdown in case of over temperature. The over temperature protection circuit prevents the IC from immediate destruction under fault conditions (e.g. output continuously short-circuited) by reducing the output current. A thermal balance below 200°C junction temperature is established. Please note that a junction temperature above 150°C is outside the maximum ratings and reduces the IC lifetime. The NCV8182C allows a negative supply voltage. However, several small currents are flowing into the IC. For details see electrical characteristics table and typical performance curves. The thermal protection circuit is not operating during reverse polarity condition.

By pulling the  $V_{REF/EN}$  lead below 1.46 V typically, the IC is disabled and enters a sleep mode where the device draws less than 30  $\mu$ A from power supply. When the  $V_{REF/EN}$  lead is typically greater than 1.52 V,  $V_{out}$  tracks the  $V_{REF/EN}$  lead normally. The output is capable of supplying 250 mA to the load while configured as a similar (Figure 22), lower (Figure 23), or higher (Figure 24) voltage as the reference lead. The ADJ lead acts as the inverting terminal of the op amp and the  $V_{REF/EN}$  lead as the non-inverting. The device can also be configured as a high-side driver as displayed in Figure 25.

Figure 22. Tracking Regulator at the Same Voltage

Figure 23. Tracking Regulator at Lower Voltages

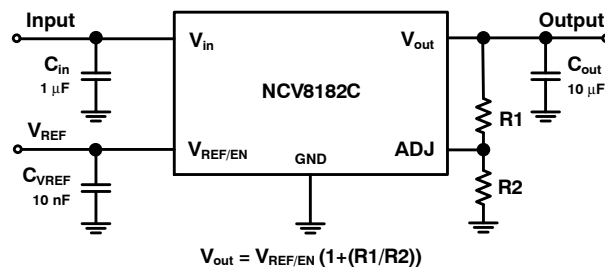

Figure 24. Tracking Regulator at Higher Voltage

Figure 25. High-Side Driver

**Thermal Considerations**

As power in the NCV8182C increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCV8182C has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCV8182C can handle is given by:

# NCV8182C

$$P_{D(MAX)} = \frac{[T_{J(MAX)} - T_A]}{R_{\theta JA}} \quad (\text{eq. 1})$$

Since  $T_J$  is not recommended to exceed 150°C, then the NCV8182C soldered on 645 mm<sup>2</sup>, 1 oz copper area, FR4 can dissipate up to 2 W for DPAK and 1.1 W for SOIC-8 when the ambient temperature ( $T_A$ ) is 25°C. See Figures 26 and 27 for  $R_{\theta JA}$  versus PCB area. The power dissipated by the NCV8182C can be calculated from the following equations:

$$P_D \approx V_{in}(I_q @ I_{out}) + I_{out}(V_{in} - V_{out}) \quad (\text{eq. 2})$$

or

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + (V_{out} \times I_{out})}{I_{out} + I_q} \quad (\text{eq. 3})$$

## Hints

$V_{in}$  and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCV8182C and make traces as short as possible. For better EMC performance on  $V_{REF/EN}$  lead it is recommended to use additional decoupling 10 nF ceramic capacitor connected between  $V_{REF/EN}$  and GND. The NCV8182C is not developed in compliance with ISO26262 standard. If application is safety critical then the below application example diagram shown in Figure 26 can be used.
