EVAL BOARD USER'S MANUAL

Introduction

The evaluation board demonstrates the NCV7694 driver as complement to the image sensor for illumination of the surroundings. The string of the series LED diodes is powered by on-board SEPIC converter with default V_{STRING} voltage of 11.8 V. The external LEDs can be also used via dedicated connector. The board contains up to three white on-board LEDs which are selected by default. The additional IR-LEDs with 850 nm or 940 nm IR wavelengths are populated, but they have to be selected manually by solder strap selector. The typical LED peak current is set by shunt resistor to 3 A.

The NCV7694 is driven from external source of the FLASH pulses. The main functionality is to limit the pulses if they exceed the maximum exposure time or if they are send too frequently. The times can be tuned by two trimmers. If the time or frequency is exceeded, it is automatically reported on the DIAG pin.

The NCV7694 has several kinds of the fault detections. Fault detection can be emulated by shorting or opening on-board jumpers. The indication LEDs can inform users about diagnostic and the status of the supplies.

Evaluation Board Features

- Wide range of supply voltage: 8 to 18 V
- Up to 3 on-board IR LEDs
- Possibility of the external LED connection
- Sepic DC/DC converter with V_{STRING} voltage of 11.8 V
- Nominal LED peak current
 - ◆ 3 A – Nominal current
- LED Open-loads, short to ground and Short to V_{STRING} emulation jumpers
- Test points for every signal
- Bypassing of the DC/DC convertor
- Single side PCB assembly

Figure 1. NCV7694GEVB Board

NCV7694GEVB

Table 1. ABSOLUTE MAXIMUM RATINGS

Rating	Value	Unit
Supply Voltage (V_{BAT})	-21 to +21	V
LED Strings Current	5	A
Junction Temperature (NCV7694, NCV898031)	-40 to +150	°C
Junction Temperature (OSLON [®] Black Series IR LEDs)	-40 to +125	°C
Ambient Temperature	-40 to +105	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 2. RECOMMENDED OPERATING CONDITIONS

Rating	Value	Unit
Supply Voltage (V_{BAT})	8 to 18	V
Rated LED current (during t_{ON})	3	A
Fault mode – board consumption ($V_{BAT} = 14$ V, status LEDs powered)	6.8	mA
Auxiliary Circuits Consumption in standby mode (NCV7694, DC/DC, LED diodes, pull-ups)	8.8	mA
Ambient Temperature	-40 to +105	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Table 3. INTERFACE FUNCTION DESCRIPTION

Connector Name	Connector Type	Description / Function
CON1	DC POWER, 2.5 mm	Input supply connector, DC 8 – 18 V
J1	1x3 header	Short two adjacent pins. Left position: Apply V_{BAT} voltage to V_{STRING} unregulated voltage Right position: DC/DC regulated V_{STRING} voltage Unconnected: no V_{STRING} supply
J_SH-GND	1x2 header	Short DET pin to GND via 10 k Ω serial resistor
J_SC	1x2 header	Short DET pin to V_{STRING} supply
J_OPEN	1x2 header	If unconnected, open load on the LEDs is present
CON_LEDs	1x2 header	Connector for external IR LED connection.
S_DG	Solder strap	Closed: DIAG pin connected to the EN pin of the DC/DC; Opened: DC/DC always active
S_W, S_IR	Solder Strap	Open S_W and Open S_IR: On-board LEDs are not used Close S_W and Open S_IR for White LED on-board configuration Open S_W and Close S_IR for IR LED on-board configuration Close S_W and Close S_IR: not permissible
S_D1ir, S_D2ir, S_D3ir, S_D1w, S_D2w, S_D3w	Solder strap	Close in case of not using the LED footprint position; Open if LED is used
DET, GATE, FB, DIAG, FRL, ETL, FLASH, VSTR, VBAT	Test Point	Test points for each signal
FLASH_in	SMB-RA	Flash Input pin (max 3.3 V)
GND1, GND2	Wire Bridge	Ground wire, global ground.

GETTING STARTED

The evaluation board is supplied through a standard 5.5 x 2.5 mm DC connector. Supply voltage range has to be from 8 to 18 V. For the supply voltage above 18 V, the board temperature can be the limitation. Jumpers J_OPEN and J1 should be connected for normal operation. After power up, the green indication LED for V_BAT supply should indicate the battery supply. The resistance of the trimmers P_ETL and P_FRL should be set in working range of 0.8 – 15 kΩ.

The NCV7694 evaluation board has to be controlled from external source of the FLASH pulses. The external source of the flash pulses can be an image sensor or waveform pulse generator. The maximum voltage of the FLASH signal is 3.3 V.

The LED current which is driven by NCV7694 can be changed replacing R1 using following formula:

$$I_{LED} = \frac{V_{FB}}{R_1} = \frac{0.3}{0.1} = 3 \text{ [A]} \quad (\text{eq. 1})$$

- I_LED – LED channel current flow
- V_FB – FB Regulation reference
- R1 – Shunt Resistor

The LED peak current is set to 3 A by default. The current can be changed by replacing the R1 resistor.

To decrease the power dissipation of the mosfet transistor, using DC/DC converter is highly recommended. The V_STRING voltage is provided by sepic DC/DC converter which is configured to have output voltage at 11.7 V. If needed the V_STRING voltage can be adjusted by replacing the R27 and R29 resistors.

The formula for V_STRING voltage using NCV898031 converter is:

$$V_{STRING} = 1.2 \frac{(R_{27} + R_{29})}{R_{29}} \quad (\text{eq. 2})$$

The DC/DC converter can be easily bypassed by shorting of the two pins on the left side of jumper J1. After bypassing the DC/DC converter, the V_STRING voltage will be powered directly from the V_BAT. Applying too high V_BAT voltage with combination with high current setting can cause high thermal dissipation on the external switching component.

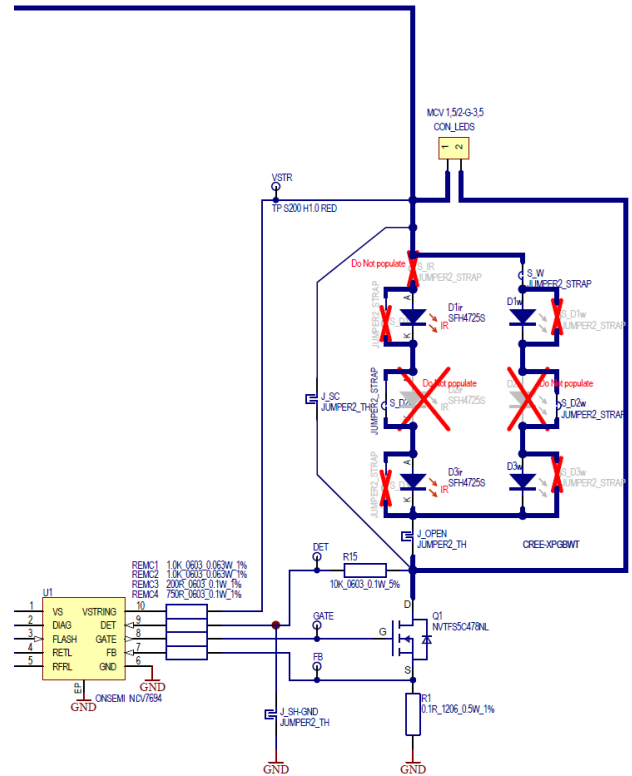

Figure 2: Schematic of the Output Stage

NCV7694GEVB

Figure 3. NCV7694 Linear Safety IR LED Driver Evaluation Board Picture

MODULES CONTROL STRATEGY

The board is designed to operate primary with DC/DC converter which creates constant voltage on the V_{STRING} supply line. The high voltage drop on the DET pin in combination with high current and maximum Duty Cycle

can cause huge power dissipation on the external switching component. To have reasonable power dissipation, the V_{STRING} voltage should be send appropriate to have reasonable voltage drop on the Q1 mosfet transistor during the active FLASH pulse.

Figure 4. Simplified Options How to Control Current Flow by the LEDs

LED STRING ON-BOARD VARIANT

Two LED string positions are present on the EVB board. The high brightness white LED string is connected by default. If the Infra LED string is required, then the solder strap has to be re-soldered manually. Since the IR light is not visible, it is customer responsibility to take a care about human eye protection as soon as the IR light is used.

Solder strap S_W is selector for White LEDs, Solder strap S_IR is selector for IR LEDs. Only one solder strap has to be connected at one time.

FAULT DETECTION

Device can detect several faults:

- IR LED faults
- RETL, RFRL faults
- Under voltage Supply
- Thermal faults

The fault is reported to the open drain DIAG pin, which can be connected to the EN pin of the DC/DC converter, which can switch off the output. The *LED faults* which can be detected are following:

- *Open Load* – The fault is reported only during the expected t_{ON} time. The fault is triggered when voltage on the FB pin drop down below 150 mV for at least 22 μ s. The fault can be emulated by opening the J_OPEN jumper.
- *Short to GND* – The fault is detected only during the t_{OFF} period. The fault is triggered when the voltage on the DET pin is below the 0.35 V for at least 10 μ s. The fault is reported and latched during whole t_{OFF} period. The fault is cleared with valid rising edge of the FLASH pulse. Fault can be emulated by shorting the J_SH_GND jumper.
- *Short to V_STRING* – The fault is detected during t_{ON} period using DET pin. If the voltage between DET pin and VSTR pin drops below 1.2 V, the fault is detected. The GATE voltage is turned off to protect the external MOSFET transistor against high power dissipation. Fault can be emulated by shorting the J_SC jumper.

The NCV7694 reads the status of the R_{ETL} , R_{FRL} resistors, to ensure correct function, the Open Load and short to Ground detection is implemented on these resistors.

- If the resistance drops below 750 Ω , then the short circuit is detected.
- If resistance is higher than 17.5 k Ω , the open load is detected.

The DIAG pin keeps reporting a fault until the resistance on that pin will come back into normal range.

MAXIMUM EXPOSURE TIME

The NCV7694 provides the safety function of the maximum exposure time and maximum frequency limitation.

If the pulse on the *FLASH input exceeds* the set value, then the output driver is switched off and it is reported on the

DIAG pin during the cut-off period. The maximum exposure time which can be set is in the range of 320 – 6000 μ s.

MAXIMUM FREQUENCY RANGE

The second safety feature is the *maximum frequency limitation*. In case if the multiple consecutively FLASH pulses are sent too frequently, all following pulses which are send during the safety T_{OFF} time are ignored and reported. The operation range for required t_{OFF} time is set by external RFRL resistor in range of 8 – 150 ms. It means, the minimum required t_{OFF} time on the FLASH input pin has to be 8 ms when $RFRL = 800 \Omega$ is used. The maximum FLASH frequency will depend on the maximum exposure time and the t_{OFF} setting.

UNDER VOLTAGE SUPPLY DETECTION

Under voltage on the VS supply is reported on the DIAG pins as soon as the voltage is below the Supply Under-Voltage Lockout 4.5 V.

THERMAL SHUTDOWN

During the thermal shutdown the DIAG pin reports a fault.

EXPOSURE TIME AND FREQUENCY LIMITATION

The safety function of the NCV7694 driver is to limit the IR-LED pulses in case of any fault on the FLASH input line. Two resistors are used for setting the maximum allowed exposure time on the output LED pulse and maximum allowed FLASH frequency.

The ETL resistor, which can be in range of 800 Ω – 15 k Ω , sets the maximum exposure time using following formula:

$$t_{ONmax} = \frac{R_{ETL}}{K_{ETL}} \text{ [ms]}$$

$$t_{ONmax} = \frac{1.25}{2.5} \text{ ms}$$

$$t_{ONmax} = 0.5 \text{ ms} \tag{eq. 3}$$

Where:

t_{ONmax} – Maximum exposure time

R_{ETL} – External resistor setting [k Ω]

K_{ETL} – ETL Coefficient with value of 2.5 k Ω x ms⁻¹

The operational range of the exposure time limitation is from 320 μ s to 6.0 ms.

The FRL resistor, which can be in range of 800 Ω – 15 k Ω , sets the minimum T_{OFF} time which needs to be present in between two FLASH pulses:

$$t_{OFF} = 1000 \times \frac{R_{FRL}}{K_{FRL}} \text{ [ms]}$$

$$t_{OFF} = 1000 \times \frac{2.5}{0.1} \text{ ms}$$

$$t_{OFF} = 40 \text{ ms} \tag{eq. 4}$$

Where:

t_{OFF} – Minimum t_{OFF} time between two FLASH pulses

R_{FRL} – External resistor setting [k Ω]

K_{FRL} – FRL Coefficient with value of 0.1 k $\Omega \times ms^{-1}$

The operation range of the maximum frequency limitation can be set in range of 8 – 150 ms for t_{OFF} time and 0.32 – 6 ms for t_{ON} time. In general pulses cannot be longer than 6 ms and cannot be send faster than 71 Hz for long pulses or 120 Hz for short pulses.

IR LEDs

The NCV7694_EVB_V1 board can operate with the various IR-LEDs from OSOLON Black product series. The centroid wavelength of the IR LEDs is from 810 nm to 940 nm. The peak current can be up to 5 A for limited time. Forward voltage of single silicon junction of IR LED is around 1.6 V. The typical IR-LED contains two junctions connected in series in one physical LED component. The V_F of these double IR LEDs is 2.75 – 3.80 V.

Table 4. LIST OF THE RECOMMENDED IR LEDs

Name	λ_{cent} [nm]	V_F [V]	Angle [°]	P_{tot} [W]
SFH 4715AS	850	3.80	90	5.8
SFH 4716AS	850	3.75	150	5.8
SFH 4725AS	940	2.95	80	5.2
SFH 4727AS	940	2.95	50	5.2

POWER DISSIPATION

The main sources of power dissipation is external switching component – Transistor Q1 and IR LEDs. The transistor NVTFS5C478 which is in WDFN8 package has maximum power dissipation $P_D = 3$ W. Thermal resistance of the transistor $R_{\theta JA}$ is 51°C/W. Thanks to the safety feature

– maximum exposure time and frequency limitation, the duty cycle will not exceed 42.9% (Worst case combination). The maximum allowed voltage drop with the maximum duty cycle setting is 2.33 V on the DET pin. User has to be careful in case of supplying the V_{STRING} voltage directly from the battery, the power dissipation has to be carefully calculated in case of worst case of ETL / FRL setting.

The typical voltage drop for one single IR LED at 3 A is 3.80 V (for SFH4715AS). The power dissipation of each IR LED for worst case scenario is 4.89 W.

For typical FLASH signal with duration of 1.5 ms at 60 Hz, the duty cycle is 9%, the maximum voltage drop which can be applied to the DET pin is 11.1 V. For typical usage there is enough power dissipation margin work directly from unregulated battery supply. The Power consumption of the IR LED with 9% duty cycle is ~1 W.

The formula to calculate thermal heating of the external transistor is following:

$$\Delta T_j = R_{\theta JA} \times (V_{DET} - V_{FB}) \times I_{LED} \times DC \text{ [}^\circ\text{C]}$$

$$\Delta T_j = 51 \times (4.0 - 0.3) \times 3.0 \times 0.09^\circ\text{C}$$

$$\Delta T_j = 50.95^\circ\text{C}$$

(eq. 5)

Where:

ΔT_j – Increase temperature of the component

$R_{\theta JA}$ – Thermal Resistance Junction – Ambient

P – Power dissipation of the component

V_{DET} – Voltage drop on the Drain pin

I_{LED} – LED Output current

DC – Duty cycle

V_{FB} – FB reference voltage of 0.3 V

The junction temperature of the transistor will raise about 51°C above ambient temperature when the overall power dissipation on the mosfet transistor will be 1 W.
